BASISCURSUS ULTRASONE GEBITSREINIGING

Tijdens deze cursus die wij in samenwerking met Acteon organiseren hebben wij het uitgebreid met u over ultrasone gebitsreiniging. Hoe werkt ultrasoon? Welk tipje gebruik ik waarvoor? Wat te doen bij implantaten?

Ook praktische tips en onderhoud komen aan bod tijdens deze cursus. Na afloop van deze cursus maakt u optimaal gebruik van uw ACTEON ultrasoon apparaat!

PERIO, IMPLANT AND PROSTHETIC INTEGRATION - KEYS FOR PREDICTABILITY AND SUCCESS IN AESTHETIC ZONE

Nowadays the aesthetic rehabilitation requires an increasingly intense multidisciplinary interaction. Separate specialties lead to inadequate and often patient dissatisfaction with the end result. The planning, with the union of pink and white aesthetic is the key to the predictability and success in clinical cases.

Development of aesthetic restorations requires a careful, thorough and concise team approach. The correct design of the gingival margin will significantly affect the overall appearance of the restorations, and the development of scalloped interdental papillae is equally paramount to restorative success.

Tooth morphology can only be re-established in a natural way when the soft tissue is compatible with aesthetic principle. Therefore, periodontology is an important and indispensable tool to achieve excellence in aesthetic zone combining pink and white aesthetic.

SOFT TISSUE MANAGEMENT, THE ULTIMATE UPDATE WITH THE SOFT BRUSH TECHNIQUE

Growing bone is fascinating, and clinicians have developed many techniques in that matter, most of them restricted to an elite.

We have developed a concept that is guided by the biology with the goal of stimulating angiogenesis at every step of the surgical procedure, and therefore we introduce a simplified protocol for the vertical and horizontal regeneration of the posterior mandible using sticky bone, A-PRF and a simple titanium mesh.

The flap management including the coronal advancement of the lingual flap will also be reviewed, and a simplification protocol of the soft tissue, known as the Soft Brushing Technique will be presented and also performed during the hands-on.

DIGITAL WORK FLOW IN BONE AUGMENTATION PROCEDURE

Digital dental technology has entered the mainstream stage, and is clearly beyond the innovator and early adopter stage. These digital innovations provide clinicians with tools for diagnosis, treatment planning, placement and restoration of oral implants in a truly transformative way.

Whereas Guided Implant Surgery and implant planning software, for prosthetically driven implant planning and placement, is already available for over 15 years, the focus of "the digital workflow" nowadays lays on the prosthetic part of implant dentistry.

Nevertheless, gradually digital technology makes his entrance in bone augmentation procedures, allowing customized bone regeneration to fit the individual anatomy of each patient.

This lecture will provide an overview on how CAD/CAM technology might be incorporated into bone augmentation procedures. Its advantages and disadvantages will be critically discussed. A personal interpretation of CAD/CAM driven surgery will be provided.
